

CodeAlpha Task 1 - Web Scraping

Project Title

Web Scraping Using Python

Objective

The objective of this project is to collect data from a website using web scraping techniques. The extracted data is processed and stored in a structured format for further analysis.

Tools Used

- Python
- BeautifulSoup
- Requests
- Pandas
- Online Python Compiler
- GitHub

How to Run

1. Open an online Python compiler.
2. Copy and paste the Python code into the editor.
3. Run the program.
4. The script will scrape data from the target website and display the extracted information.
5. The output can be saved for further analysis.

Output

- Successfully extracted data from a webpage.
- Displayed the scraped data in a structured format.
- Prepared the data for further analysis and visualization.

Internship Details

This project was completed as part of the CodeAlpha Data Analytics Internship Program.
